

Fossil Identity

Limestone is the most common rock type found throughout the Geopark.

If you have any limestone rock within your garden, why not go on a fossil hunt to see if you can spot any of the fossils in the picture below.

If you can't find any then don't worry, they can be tricky to spot. Instead you could always complete the Activity Sheets from Geoschol.

Colour in and cut out the Carboniferous life that would have been found in the tropical sea in the Geopark 340 million years ago and stick to the background provided.
